                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠ
                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel human cancer-related genes and proteins (AB278120-AB278168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humancal or cellular immune response. The genes are useful for proteins and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
3 protein (amino acids 251-265) and is implicated as a self epitope in pemphigus vulgaris. Peptides derived from the human desmoglein protein are described in AAW04841-47
                                                                                                                                                                                           Gaps
                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, an as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hubert RS;

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present equence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                    New composition comprising a substance that modulates the structure of proteins and polynuclectides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.
                                                                                                                                                                                                                                      Hubert RS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, cytostatic, vaccine, cancer, immune response, HLA;
human leukocyte antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              6; Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and poptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                           proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                   proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in

                                                The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers or the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and the rapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                is a Ca2+ dependent cell adhesion protein. Antibodies or fragments that specifically bind the epitope can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is an antigenic epitope from human cadherin-5,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ca2+ dependent; cell adhesion protein; cadherin; human; antibody; purification; determination; epitope; tissue expression; binding antagonist; calcium ion; antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibodies to cadherin proteins - useful as cadherin antagonists,

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for aliciting a humoral or callular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                           Human; cytostatic; vaccine; cancer; immune response; HLA; human leukocyte antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 40; DB 6; Length 15; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel human cancer-related genes and proteins (AB278120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or diagnosis and/or prognesis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therappeutic agents. The proteins and poptides are useful as therapoutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or callular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention
                                                                                                                                                                                     New composition comprising a substance that modulates the structure of proteins and polynuclectides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hubert RS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                            The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humonral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the adjaponsis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
 New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        proteins and polynuclectides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.

The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers or the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.
                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                         ö

T-cell receptor alpha chain (H1) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Date: 17-Jul-1992 #sequence_revision 17-Jul-1992 #text_change 30-May-1997
C;Accession: PH0799
R;Casanova, J.L.; Romero, P.; Widmann, C.; Kourilsky, P.; Maryanski, J.L.
J. Exp. Med. 174, 1371-1383, 1991
A;Title: T cell receptor genes in a series of class I major histocompatibility complex-rallelic exclusion and antigen-specific repertoire.
A;Reference number: PH0746; MUID:92078846; PMID:1836010
A;Accession: PH0799
A;Molecule type: mRNA
A;Residues: 1-13 - CAS>
A;Cross-references: EMBL:X60905
A;Experimental source: T lymphocyte
C;Keywords: T-cell receptor

01-NOV-1998 (TrEMBLrel. 08, Last annotation update)
Sucrose synthetase gene mutant (Sh-5586 allele) containing transposon
Tag6, 5' end of Tag6. (Fragment).
Zea mays (Maize).
                                        "Isolation and identification of multiple neuropeptides of the allatostatin superfamily in the shore crab Carcinus maenas.";
Eur. J. Biochem. 250:727-734 (1997).

-I - FUNCTION: May act as a neurotransmitter or neuromodulator.

-I - SIMILARITY: Belongs to the allatostatin family. Neuropeptide.

MOD RES 8 Leucine amide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Eur. J. Biochem. 250:727-734 (1997).
-1- FUNCTION: May act as a neurotransmitter or neuromodulator.
-1- SIMILARITY: Belongs to the allatostatin family.
Amidation; Direct protein sequencing; Multigene family; Neuropeptide.
MOD RES 9 Leucine amide.

antigens Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antic - useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease.

Claim 1; Page 41; 58pp; English.

Pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MRC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is derived from the human desmoglein

```
The invention provides nucleic acids encoding rat, mouse and human sensory transduction G-protein coupled receptor (GPCR) polypeptides. The GPCR polypeptides are components of the taste transduction pathway. The nucleic acids can be used to identify taste cells and as tools for the generation of taste topographic maps that elucidate the relationship between the taste cells of the tongue and taste sensory neurons leading to taste centers in the brain. GFCR-B4 is a nucleic acid probe for identifying subpoulations of taste receptor cells such as foliate, fungiform, and circumvallate taste receptor cells. The polypeptides can be used for identifying compounds that medulate sensory signaling in sensory cells. Such modulators of taste transduction are useful for pharmacological and genetic modulation of taste signaling pathways. These
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated sensory transduction G-protein coupled receptor, useful for developing products for use in studying and modulating the taste transduction pathway and for generating taste topographic maps.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modulatory compounds can then be used in the food and pharmaceutical industries to customize taste. The present sequence represents a GPCR-B4
yearen (amino acids 512-526) and is implicated as a self epitope in
pemphigus vulgaris. Peptides derived from the human desmoglein protein
are described in AAW04841-47

system. Misni gene products contain a novel calcium pore sequence which is a part of the capacitative calcium channel in immune cells such as accordages, monocytes, T-cells, B-cells and mast cells. Misni sequences are useful for screening Misni modulators and for diagnosing disorders associated with aberrant lorac function in immune cells. They are useful for screening ligand substances or molecules that are able to modulate the biological activity of Misni. The compound identified as modulate that bind and/or modulate the biological activity of Misni. Sequences of the invention are useful for treating immuno degenerative disorders: They are also useful for developing biomarkers for immune system activation or autoimmune or inflammatory diseases (e.g., arthritis, organ rejection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel Misni polypeptide and nucleic acid encoding the polypeptide, useful for screening Misni modulators and for diagnosing disorders associated with aberrant lcrac function in immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The patent discloses novel human Misni polypeptides and polynucleotides encoding them. The invention also relates to the characterisation of capacitative calcium channel homologue for the activation of immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                autoimmune or inflammatory diseases (e.g., arthritis, organ rejectic COPD), as modulators of immune system activation and as therapeutic targets. Misni sequences are also used for antisense gene therapy. I

The present peptide is a tumour necrosis factor alpha (TNP-alpha) inhibitor, which can be used to treat TNF-alpha mediated disorders, e.g. septic shock, bacterial, viral and fungal infections, autoimmune diseases, alcohol induced hepatitis, asrcoiditis, Crohn's disease, disease, alcohol intravascular coagulation, graft versus host disease, the sameaski's disease and TNF-alpha secreting tumours. The peptide is preferably given as a daily dose of 1-1000, preferably 1-10 mg/Kg, and has an IC50 of 155 microM against binding of TNF-alpha to a p55TNFr-IgG
                                                                                      Tumour necrosis factor, alpha, TNF-alpha; inhibition, treatment, mediation; disorder; septic shock; bacterium; virus; fungus; infection; autoimmune; disease; alcohol inced hepatitis; sarcoiditis; Crohn's; disseminated intravascular coagulation; graft versus host; Rawasaki's;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tumour necrosis factor, alpha, TNF-alpha; inhibition; treatment; mediation; disorder; septic shock; bacterium; virus; fungus; infection; autoimmune; disease; alcohol induced hepatitis; sarcoiditis; Crohn's; disseminated intravascular coagulation; graft versus host; Rawasaki's;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide inhibiting tumour necrosis factor alpha - useful for treating septic shock, infections, autoimmune diseases, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         37.8%; Score 31; DB 2; Length 12; 71.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a purified or isolated N-terminal polypeptide region, C-terminal polypeptide region, extracellular and intracellular cegion, C-terminal polypeptide region, extracellular and intracellular loop regions, of human Icrac-MBanl (major capacitative calcium channel).

I crac-MBanl DNA and protein are useful for screening ligand substances or molecules that are able to bind to a lorac-MBanl and modulates the activity of antigen presenting cells especially macrophages maturation.

I crac-MBanl is also useful for screening ligand substances or molecules that are able to modulate the biological activity of Icrac-MBanl, where a change in calcium flux or activation potential within the exposed recombinant cell is measured, and where the recombinant cell expresses a competitor MBanl binding ligand, is selected from the class of pyrazol compounds is added and the binding of the competitor in the presence and/or absence of a test compound is determined. Icrac-MBanl useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptide regions of major capacitative calcium channel and polynucleotide regions useful for screening modulators of channel activity for regulating activity of antigen presenting cell especially of

The invention comprises synthetic peptides that have chaperone activity. The peptides of the invention are useful in the treatment of transmissible spongiform encephalopathies. Creutzfeld-Jakob disease, scrapie and bovine spongiform encephalopathy. The present amino acid sequence represents a peptide that was used in the exemplification of the
                                                                                                                                                                                                        The present peptide is a tumour necrosis factor alpha (TNF-alpha) inhibitor, which can be used to treat TNR-alpha mediated disorders, e.g. septic shock, bacterial, viral and fungal infections, autoimmune diseases, alcohol induced hepatitis, sarcoiditis, Crohn's disease, disease and TNR-alpha secreting tumours. The peptide is preferably given as a daily dose of 1.1000, preferably 1.10 mg/Kg, and has an ICSO of 307 microM against binding of TNR-alpha to a p55TNFr-IgG
                                                                                                               Peptide inhibiting tumour necrosis factor alpha - useful for treating septic shock, infections, autoimmune diseases, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New synthetic peptide having chaperone activity, useful for treating transmissible spongiform encephalopathies such as Creutzfeld-Jakob disease and scrapie.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chaperone peptide; transmissible spongiform encephalopathy;
Creutzfeld-Jakob disease; scrapie; bovine spongiform encephalopathy.

The autoantibody found in patients with primary biliary cirrhosis. The artibody is useful as a diagnostic reagent, e.g. for monitoring whether a transplanted liver in a patient with primary biliary cirrhosis, is expressing a mitochondrial antigen bound by an autoantibody. The antibody is also useful for purifying an antigen to which it binds, for producing an anti-idiotype antibody to it, or as a reagent to screen for antagonists to it, either in vivo or in vitro. The antagonist is useful for treating a patient with primary biliary cirrhosis, or for prophylactically treating a patient about to have primary biliary cirrhosis. Sequences ABRS5890-98 represent CDR3- junction sequences of the kappa light chains of the anti-intochondrial antigen human monoclonal antibodies (mAbs) 286, 4D11, 1C7, 2C8, 3B4, 4G6, 4C2, 2E11 and 3B10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New anti-mitochondrial antigen specific human monoclonal antibodies from patients with primary biliary cirrhosis (PBC), useful as a diagnostic reagent, or as a reagent for screening antagonists for treating patients with PBC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the adjaponsis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                   New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       interleukin-1; type I receptor; IL-1RtI; agonist; antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       37.8%; Score 31; DB 6; Length 15; 60.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therappeutic agents. The proteins and poptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in

```
The invention relates to peptides which bind to the IL-1 type I receptor and which comprise the motif WXXXG-Z1-W or the motif XXQ-Z5-Y-Z6-XX, in which X can be any one of the 20 genetically coded Lamino acids or the stereoisomeric D-amino acids or unnatural amino acids; Z1 is L, I, A or Q; Z5 is P or azetidine (presumably intended to be azetidine carboxylic acid); and Z6 is S, A, V or L. The present sequence is that of a random peptide from a library of peptides containing the "XXQ-Z5-Y-Z6-XX" motif, the library being constructed to screen the peptides for activity. IL-1 type I receptor-binding peptides may be useful in the treatment of a rathitis, osteoporosis, HIV infection and AIDS, bacterial infection, respiratory distress syndrome, acute myelogenous leukaemia, graft versus cost miner pneumoconiosis, alcoholic cirrhosis, cuprophane haemodialysis, cardiopulmonary bypass, chronic hepatitis B, tuberculosis, obstructive jaundice, Paget's disease and osteomalacia, IDDM, Kawasaki's disease, inflammatory bowel disease, sepsis, toxic shock and luteal phase
                       Interleukin-1 type I receptor inhibitor peptide(s) and compounds to antagonise the activity of IL-1, for treatment of e.g. AIDS, rheumatoid arthritis, chronic hepatitis B, etc.
                                                                                                                                       Disclosure; Page 22; 74pp; English

ል Antagonisation of action of interleukin-1 on type I receptor contacting receptor with selected peptides.

Disclosure; Col 13; 118pp; English

AAW68666-75 represent random peptide sequences, identified from a peptide

library based on the peptide AAW68899. The peptides antagonise the action of interleukin-1 (IL-1) by binding to an IL-1 type I receptor (IL-1Rt1). The peptides are used in the treatment of disorders mediated by IL-1, e.g. atherosclerosis, arthritis, osteoporosis, AIDS, bacterial infections, respiratory distress syndrome, acute myelogenous leukaemia, graft-versus-host disease, pneumoconiosis, cirrhosis, cuprophane haemodialysis, cardiopulmonary bypass, hepstitis B, thermal injury, reticulohisticcytosis, sarcoidosis, tuberculosis, obstructive jaundice, paget's disease, osteomalacia, diabetes, Kawasaki's disease, inflammatory bowel disease, sepsis, toxic shock and luteal phase

Peptide(s) that bind to interleukin-1 type I receptor - useful in screening assays for interleukin receptors blockers, diagnosis and therapy.

Disclosure; Col 11; 89pp; English.

A compound has been developed that binds to an interleukin-1 (IL-1) type I receptor with an ICSO of 2.5 mM or less and has a molecular weight of 3.8 kD, where the binding of the compound to the receptor is competitively inhibited by a peptide of 8-25 amino acids comprising the core sequence: 37-28-Q-25-Y-26-29-210, where 25 = Pro or azetidine; 26 = Ser, Ala, Val or Leu; 27 = TY, Trp or Phe; 28 = Glu, Phe, Val, Trp or TYr; 29 = Met, Phe, Val, Arg, Glu, Lys, Thr, Ser, Asp, Leu, Ile or Glu; and 210 = Glu, Leu, Trp, Val, His, Ile, Gly, Ala, Asp, Leu, Ile or Glu; and 210 = Glu, Leu, Trp, Val, His, Ile, Gly, Ala, Asp, Tyr, Asn, Gln or Pro. Peptides of the invention are used in screening assays for IL-1 receptor blockers. They are also used as probes for detecting IL-1 type I receptor brokers. They are also used as probes for detecting IL-1 type I receptor expression on the surface of cells. The peptides are useful in treating IL-1-related disorders, AlDS, bacterial infection, respiratory distress syndrome, acute myelogenous leukaemia (AML), graft versus host

```
CC disease, coal miner pneumonoconiosis, alcoholic cirrhosis, cuprophane CC haemodialysis, cardiopulmonary bypass, chronic hepatitis B, thermal CC injury, reticulohisticoytosis, sarcoidosis, tuberculosis, obstructive CC jaundice, Paget's disease and osteomalacia, Kawasaki's disease, CC inflammatory bowel disease, sepsis, toxic shock, and luteal phase. The CC present sequence represents a peptide from the present invention XX SQ Sequence 12 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease.

Claim 1; Page 42; 58pp; English

pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP).

By Olypeptide Which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is derived from the human desmoglein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from

```
kinase activity in situ, comprising a molecule capable of modulating a kinase activity in situ, comprising exposing a candidate molecule to a cell comprising a phosphorylation substrate associated with a detectable cell comprising a phosphorylation substrate sasociated with a detectable label and having a kinase recognition domain altered to be recognised by a kinase that does not recognise the substrate in its unaltered state, and determining whether the candidate molecule causes a change in an expression of the label. Also included are a molecule capable of calaimed method, a fusion protein (comprising an E3 binding region, a kinase recognition domain is the domain of beta-catenin, HIV protein VPU, or a kinase recognition domain is the domain of beta-catenin, HIV protein VPU, a kinase recognition domain and an enzyme capable of producing a kinase recognition domain and an enzyme capable of producing a catectable enzymatic product, where the kinase recognition domain is the comprised of producing a consoluted genetic molecule encoding one of the above fusion proteins, a vector capable of expressing the above genetic molecule and a cell contained such a such that above vector. Expression of the label requires the phosphorylation substrate by the kinase recognition domain is altered to include a consensus recognition contition domain is altered to include a consensus recognition containing and to screen for molecules that modulate kinase contition on multiple kinases to be provided simultaneously, which prior art does not provide. The present sequence is a mutated Beta-Trep of the fortune for provide. The present sequence is a mutated Beta-Trep of the defined) phosphorylation site.
                                                                                                          Identifying a molecule capable of modulating a kinase activity in situ using a substrate with an altered kinase recognition domain and an associated label is useful in drug discovery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 kinase activity modulator; signaling enzyme; drug design; anti-tumour; anti-inflammation; anti-ischaemia; necrosis factor kappa B regulating protein; NFKB-regulating protein; I kappa B-alpha; cytokine inducible IkappaB kinase recognition site; IKK recognition site; phosphorylation; serine/threonine kinase; AKT;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mutant NFkB-regulating protein IkB-alpha IKK recogntion #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  37.5%; Score 30; DB 7; Length 15; 62.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence identified from SIVmac env is equivalent to HIV500 (AAQ12641). Because of the criteria used to correlate HIV and SIV sequences, observation of the antibody response of monkeys immunised with an SIV sequence could be used to assess the artibody response of humans immunised with the corresp. HIV sequence. See also AAQ12640-47
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IkappaB-alpha; AKT kinase; beta-TrCP; kinase; phosphorylation substrate;
kinase recognition domain; E3 binding region; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention describes a method of identifying a molecule capable of modulating a kinase activity in situ, comprising exposing a candidate condulating a xinase altered so as to bind a phosphorylation substrate, where the substrate is associated with detectable label and the binding is regulated by a kinase, and determining whether the candidate causes a change in expression of the cale abel. Also described are: a molecule capable of modulating a kinase activity in situ identified by the claimed method; a fusion protein calivity in situ identified by the claimed method; a fusion protein calivity in situ identified by the claimed method; a fusion protein calivity in situ identified by the claimed method; a fusion protein comprising a genetically altered signaling enzyme and a label, where the cale into a phosphorylation substrate that the enzyme does not bind in its unaltered state, where the binding is regulated by a kinase; and cof binding to a phosphorylation substrate that the enzyme does not bind in its unaltered state, where the binding is regulated by a kinase; and capable of expressing the above genetic molecule; and a cell transfected with the above vector. The invention is useful in drug design to screen capable of expressing the above genetic molecule; and a cell transfected canti-ischaemia therapy. This is the amino acid sequence of a necrosis factor kappa B (NFRB) regulating procein I kappa B-lapha cytokine in the phosphorylation subscribe and a been altered to contribe the phosphorylation subscribe and a cell transfered to contribe and a cell that has been altered to contribe the propertion of the condition site that has been altered to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method for identifying a molecule capable of modulating a kinase activity in situ and is useful in drug design to screen for molecules that are candidates for anti-tumor, anti-inflammation, and anti-ischemia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modulating a kinase activity in situ, comprising exposing a candidate molecule to a cell comprising a signaling enzyme altered so as to bind a phosphorylation substrate, where the substrate is associated with detectable label and the binding is regulated by a kinase, and detectable label and the binding is regulated by a kinase, and detectable label and the binding is regulated by a kinase, and cativity in situ identified by the claimed method; a fusion protein comprising a genetically altered signaling enzyme and a label, where the alteration produces an adapter molecule in the signaling enzyme capable of binding to a phosphorylation substrate that the enzyme does not bind in its unaltered state, where the binding is regulated by a kinase; an isolated genetic molecule encoding the above fusion protein; a vector capable of expressing the above genetic molecule; and a cell transfected with the above vector. The invention is useful in drug design to screen for molecules that are candidates for anti-tumour, anti-inflammation, and anti-ischaemia therapy. This is the amino acid sequence of a necrosis factor kappa B (NFkB)-regulating protein I kappa B-alpha cytokine inducible IkappaB kinase (IKK) recognition site that has been altered to allow phosphorylation by serine/threonine kinase AKT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                    A method for identifying a molecule capable of modulating a kinase activity in situ and is useful in drug design to screen for molecules that are candidates for anti-tumor, anti-inflammation, and anti-ischemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       activity modulator; signaling enzyme; drug design; anti-tumour;

The invention relates to a fusion protein comprising a pair of sequestering motifs, an enzyme-binding region and a label, where the sequestering motifs and each side of the enzyme-binding region which is prevented from biding to a signalling enzyme when the motifs interact with each other and the interaction is regulated by a kinase. The sequestering motifs comprises a phosphorylation substrate for the kinase and a binding motif for the phosphorylation substrate. Interaction cheween the phosphorylation substrate and the binding motif requires to phosphorylation of the substrate by the kinase. The binding motif is comprises substantially a ligand-binding region of a 14-3-3 protein or SHZ domain and an adapter molecule which is a PDZ, SHJ, WW, PTB or FHA comprises substantially a ligand-binding region of a 14-3-3 protein or SHZ domain is an E3-binding region, preferably comprising a PHST or is a transporting protein. The label is fluorescent, preferably green of luciferase. The method is useful to test and design drugs with various clinical applications including anti-inflammatory candidate molecules, anti-tumour therapies, immune response regulating drugs and anti-ischaemmic drugs. The present of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                 A fusion protein comprising a pair of sequestering motifs, an enzymebinding region and a label is useful to test and design drugs e.g. anti-inflammatory, anti-tumor, immune response regulating and anti-ischemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Drug designing; clinical application; anti-inflammatory; anti-tumour; immune response; anti-ischaemic; artherosclerosis; therapy; IkappaB-alpha; mutant; mutein.

The invention relates to a method for identifying molecule capable of modulating kinase activity in situ. The method involves exposing candidate molecule to cell having signalling enzyme altered to bind phosphorylation substrate associated with detectable label where the binding between altered signalling enzyme and substrate is regulated by a kinase and determining if the candidate molecule cause a change in expression of label. The method is useful for testing and designing drugs with various clinical application e.g. anti-inflammatory candidate molecules. The invention is useful in the field of anti-tumour therapeutics and immune response regulating drugs. The method is also useful for developing anti-ischaemic drugs that are useful for treating artherosclerosis. The present sequence is IkappaB-alpha mutant substrate peptide. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying molecule capable of modulating kinase activity in situ, by exposing candidate molecule to cell comprising signaling enzyme altered to bind substrate having label and determining whether molecule changes expression of label.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Drug designing; clinical application; anti-inflammatory; anti-tumour; immune response; anti-1schaemic; artherosclerosis; therapy; IkappaB-alpha; mutant; mutein.

The peptide sequences AAW59298-W59344 are amplified by primers to detect the presence of a non-polio enterovirus (NPEV) in a sample. The primers and assays are used to detect NPEW9 in a sample, to serotype these viruses, to diagnose enteroviral diseases and medical conditions, and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                correlate (or disprove a correlation between) specific symptoms or combinations of symptoms with the presence of a particular enterovirus. They can be used for diseases such as aseptic meningitis. The detection of NEV infections and their correlation with medical conditions will make possible vaccines and methods of treatment
                                                                                                                                                                                                                                                             Identifying non-polio enteroviruses - using primers which hybridise to sense and antisense strands that encode conserved non-polio enterovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a conserved Coxsackievirus B (serotype B1) VP1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Virus; epitope; target; degenerate; PCR; primer; amplification; VP1; nonstructural protein 2A; conserved; base analogue; inosine; predetermined nucleotide; diagnosis; enterovirus; poliovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 29; DB 2; Length 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for identifying molecule capable of modulating kinase activity in situ. The method involves exposing candidate molecule to cell having signalling enzyme altered to bind phosphorylation substrate associated with detectable label where the binding between altered signalling enzyme and substrate is regulated by a kinase and determining if the candidate molecule cause a change in kinase and determining if the method is useful for testing and designing drugs with various clinical application e.g. anti-inflammatory candidate molecules. The invention is useful in the field of anti-tumour therapeutics and immune response regulating drugs. The method is also useful for developing anti-ischaemic drugs that are useful for treating artherosclerosis. The present sequence is IkappaB-alpha mutant substrate peptide. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying molecule capable of modulating kinase activity in situ, by exposing candidate molecule to cell comprising signaling enzyme altered to bind substrate having label and determining whether molecule changes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Non-polio enterovirus; NPEV; enteroviral disease; aseptic meningitis;

epitope. The invention relates to a novel method for designing degenerate PCR primers (AA230975-Z31000, AAZ32611 for amplifying target polynucleotides. This method comprises identifying uniquely conserved amino acid sequences (e.g., this epitope) in target proteins; synthesising degenerate polynucleotides encoding the conserved sequences; and degenerate polynucleotides encoding the conserved sequences; and predetermined nucleotides (e.g., inosine) at degenerate nucleotide positions. The nucleot acids comprise no more than 7 degenerate positions, have no more than 2 adjacent predetermined nucleotides and the predetermined nucleotides are 3 bases away from the 3' end of the synthesised strand. The degenerate primers are useful for amplifying strates polynucleotides by the polymerase chain reaction (PCR). The use of the method of designing degenerate primers useful for the detection of polioviruses in clinical samples is described in USSSS477. The degenerate the amino acid sequence encoded is known. The primers also allow for the correlation of the subsequence molecular based diagnosis with a
                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            IgE; C epsilon3; C epsilon4; histamine release inhibitor; vaccine; antibody; epitope; mimotope; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to linkage methodology for use in the conjugation of compounds (e.g. peptides) to carrier vehicles (e.g. macromolecules, polymers, dendrimers, proteins) to produce biological and immunological constructs. The invention provides a method for linking an epicope (e.g. a peptide) to a carrier (e.g. a protein) for use in a pharmaceutical composition or a vaccine. The invention describes peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, linkage technology; conjugated compound; carrier vehicle; epitope; Cepsilon2; Cepsilon3; Cepsilon4; immunoglobulin E; IgE mediated disease;
from C-
                                                                                              The present invention relates epitopes and mimotopes of an isolated surface exposed epitope of C epsilon3 or C epsilon4 domain of IgE. The epitopes were identified by calculating the accessible surface of each IgE residue. Mimotopes were designed to be similar to the epitopes. The epitopes are useful in preparing medicaments for treating or preventing allergies. The epitopes and mimotopes of the invention induce anti-IgE antibodies which are capable of relaing non-anaphylactic antibodies and inhibiting histamine release. The present sequence is a IgE C epsilon3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                comprising an immunogenic conjugate useful treatment of IgB
